Case Study

Objective:

- Understand and practice linear discriminant analysis using scikit learn.

Questions:

1. We shall use the same dataset used in previous assignment - digits. Make a 80-20 train/test split.
[Hint: Explore datasets module from scikit learn]
2. Using scikit learn perform a LDA on the dataset. Find out the number of components in the projected subspace.
[Hint: Refer to discriminant analysis module of scikit learn]
3. Transform the dataset and fit a logistic regression and observe the accuracy. Compare it with the previous model based on PCA in terms of accuracy and model complexity.
[Hint: Project both the train and test samples to the new subspace]
